Product Description – Additional Modules	Module Cost	Maintenance Cost
<p>ControlPoint 5 TB</p> <p>ControlPoint is an intricate component of Micro Focus’s Information Management offering, designed to bring unmanaged content under control and address the needs for data access, consolidation, privacy, analytics, discovery, risk and value. It works both independent of Content Manager, and as a tightly integrated module of Content Manager.</p> <p>The evolution of Content Manager from TRIM is a significant aspect of the solution’s roadmap. TRIM may have started with Records Keeping (therefore compliance and governance) as the primary area of concern for IM professionals, but over the last 20+ years it has evolved along the lines of not only market trends and customer needs for innovation,</p>		

but as a strategic component for management of all types of content, and providing itself as a base for a comprehensive platform, managing data from unstructured repositories as well as databases. ControlPoint is a necessary component of that data management platform for all unstructured repositories, providing visibility into legacy data, facilitating transparent management, in-place management, discovery of personal and potential data privacy content, discovery of intellectual property, a 360 degree view of both the content and the metadata around data, the ability to auto categorise or classify content, build relationships of similar content across multiple repositories to enhance data value, and become a strategic system for risk, privacy and data management policies. ControlPoint not only indexes and analyses and classifies data, it also comes with an in-built policy execution engine to archive, move, capture and delete data based on the business requirements.

Please note: 10 TB & 15 TB are also available in this promotion. Please enquire.

Product Description – IK CM Value Add Products

IK CM Revisions Analyser

Managing changes to documents is easy with your HPE TRIM/RM/CM solution and happens automatically. Changes occur regularly and managing the revisions history can become a complicated task over time. Do I need to keep revisions? How many revisions do I keep? These are all valid questions that you should ask. Revisions are kept in the HPE TRIM/RM/CM Document Store and can take up a reasonable amount of disk space. If you could minimise the amount of revisions in your solution you might save a considerable amount of disk space making it cheaper and easier to manage.

The IK Revisions Analyser has been specifically developed with this in mind. To give you full visibility of your entire document revisions count and telling you how much disk space these

revisions consume you need the IK Revisions Analyser. From a single location you can analyse revisions and, if desired, delete them from the solution.

IK CM Audit Log Analyser

Investing time analysing an audit trail is often the least favourite task. It can be very complex and time-consuming. However, it may be the only way to find out whether certain activities have occurred in your HPE TRIM/RM/CM solution. How do you find out what may have been deleted? How do you find out who made the last change? How can you prove that documents haven't been changed?

The IK Audit Log Analyser is designed specifically to analyse and process your audit log files and display them in a readable form. The system administrator can then search the entries in the log files and find exactly what is required. With an intuitive User Interface, the IK Audit Log Analyser can be used to run Analytical reports that can easily be exported and distributed.

IK CM Document Store Analyser

Similar to the accumulation of revisions in your Document Stores you could also discover that there are a large amount of "orphaned" documents left behind in your Document Store with no reference to any record in your system. Have you Deleted a large amount of records? Have you Removed a large amount of Revisions? Have you Disposed of a large amount of records? These are all valid tasks (apart from the Delete) but are you certain that the Documents have actually been removed from your system?

The IK Document Store Analyser helps you find these documents that you thought had been deleted but in fact are still on your File System. Once analysed you can then remove these

documents from the Document store freeing up considerable disk space making it easier and cheaper to manage.
